Dependence Modelling using Vine Copulas: Theory and Applications, 5 högskolepoäng

Dependence Modelling using Vine Copulas: Theory and Applications, 5 credits

Kurskod:	FJDMV30	Utbildningsnivå:	Forskarnivå
Fastställt av:	Forskarutbildningsrådet 2019-10-11		
Gäller fr.o.m.:	Hösten 2020		
Version:	1		

Syfte

Due to their flexibility, copula models are quickly gaining popularity in applied research. Copulas are

descriptions of multivariate distributions whose margins are uniform. This course gives an introduction to

the class of vine copulas and their statistical inference. Vine copula models have become very popular in

the last years for many applications in diverse fields such as finance, insurance, hydrology, marketing,

engineering, chemistry, aviation, climatology and health. This course provides an introductio

Lärandemål

On completion of the course, the students will be able to:

Kunskap och förståelse

- Demonstrate understanding and knowledge regarding the theoretical background of vine copula

models and their statistical inference.

- Demonstrate understanding regarding the difference between regular, drawable and canonical

vines.

Färdighet och förmåga

- Interpret and analyze results derived from vine copula models.
- Perform statistical tests in the framework of vine copulas to select the appropriate model.
- Estimating vine copula dependence models using multivariate data.
- Apply the statistical software R to conduct copula-based modeling and perform simulations based on the estimated model.

Värderingsförmåga och förhållningssätt

- Critically evaluate the appropriateness of vine copulas in multivariate data analysis

Innehåll

The course starts with a background chapter on multivariate and conditional distributions and copulas. This includes the parametric classes of elliptical, Archimedean and extreme value copulas. Their parameter estimation and graphical tools for the identification of sensible bivariate copula models to data are presented. The decomposition and construction principle of drawable (D-), canonical (C-) and regular (R-) vines is developed and discussed. The course concludes with recent extensions of vines including advances in estimation, model selection, for special data structures and reviews major applications in finance, life and earth sciences, insurance and engineering. It also provides an overview of the available software, in particular R, to select, estimate and visualize vinebased models.

Undervisningsformer

The course is designed as a series of lectures, seminars and computer labs.

Undervisningen bedrivs på engelska.

Förkunskapskrav

Admitted to a doctoral program in statistics or a related subject of a recognized business school or university.

Examination och betyg

Kursen bedöms med betygen Underkänd eller Godkänd.

This course is examined using a course paper where a copula-based modeling of multivariate data should

be performed. This paper deals with ILOs 1,2,3,4,5,6,7

The grades given are pass or fail.

Kursvärdering

A course evaluation will be conducted at the end of the course.

Kurslitteratur

Claudia C, Analyzing Dependent Data with Vine Copulas: A practical Guide with R, 2019, Springer, New York.
